Energy Budget Calculation

The target water heating energy use that determines whether an installed system will get a penalty (uses more than the target) or credit (uses less than the target) takes into account building floor area, climate zone, system type, efficiency, water heater type. If the installed system does not match what is shown on the CF1R for these items plus number and volume, the system should be re-modeled.

Solar Water Heating

The performance compliance approach allows for solar water heating credits. All systems installed for credit must be SRCC certified. The solar water heating credit is described as a "Solar Fraction" that describes what percent of the total water heating energy use will come from the solar system.
